Information Architecture

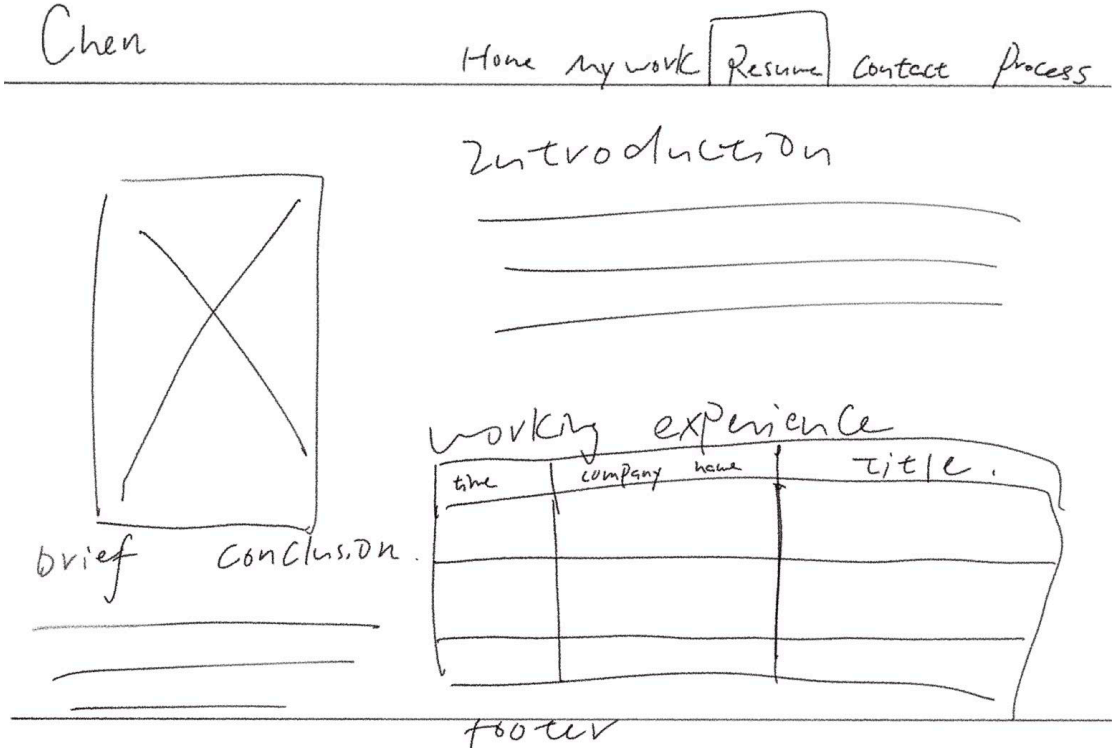

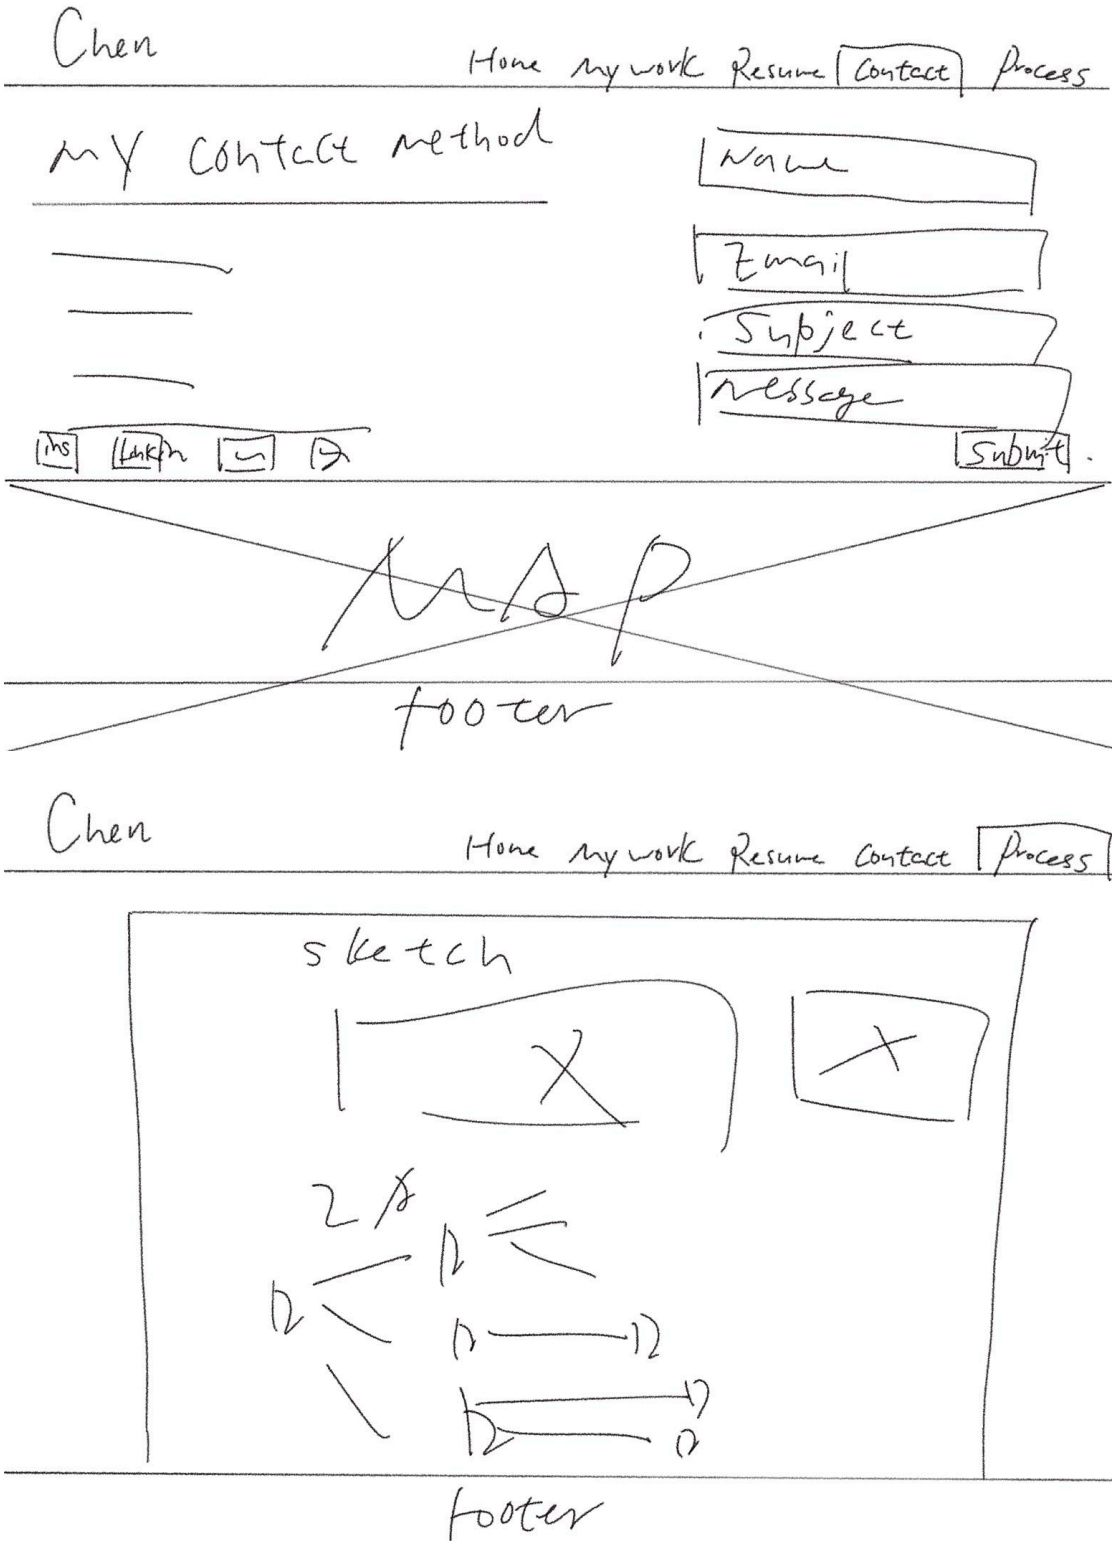

At the outset of Project 2, I commenced with Information Architecture (IA), outlining the structural framework of the interface. The IA features global navigation, effectively partitioning the website into five distinct inner pages: the Home page, Gallery page, Resume page, Contact page, and Process page. Complementing this, local navigation provides an overview of the layout and content within each inner page. This comprehensive IA delineates the fundamental information and structural organization of the entire website.

After sketching, I developed wireframes based on my sketch, maintaining most of the content but changing the layout a little bit. I unify the colour and font to make the overall design more rational and try to include rich media forms in the whole design.

Introdution

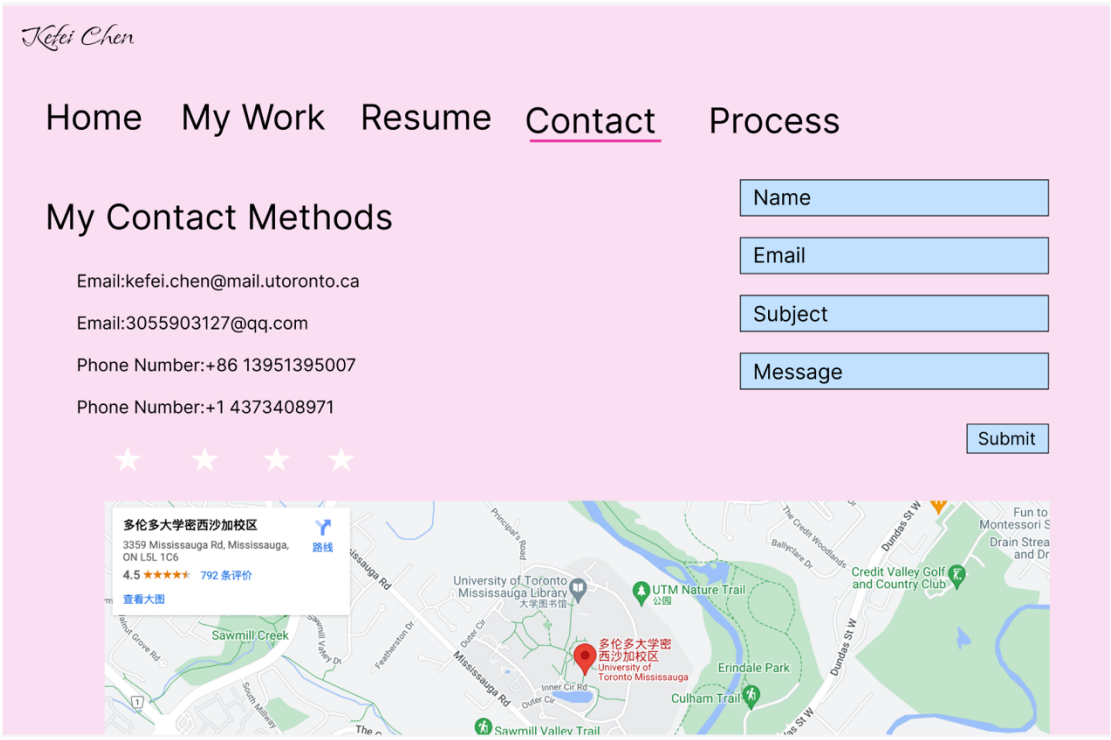

Hello, I am Susan, a second-year student at the University of Toronto, I major in CCIT(Communication, Culture and Information Technology), I enjoy travelling, Listening to music and swimming, I also like to record my life as vlogs and post them on TikTok and RED, I hope maybe one day I can be a blogger. Moreover, one fact about me is that one of my majors is Art & Art history, so I am familiar with almost every art-creating method such as print, sculpture, graphic design, painting etc.

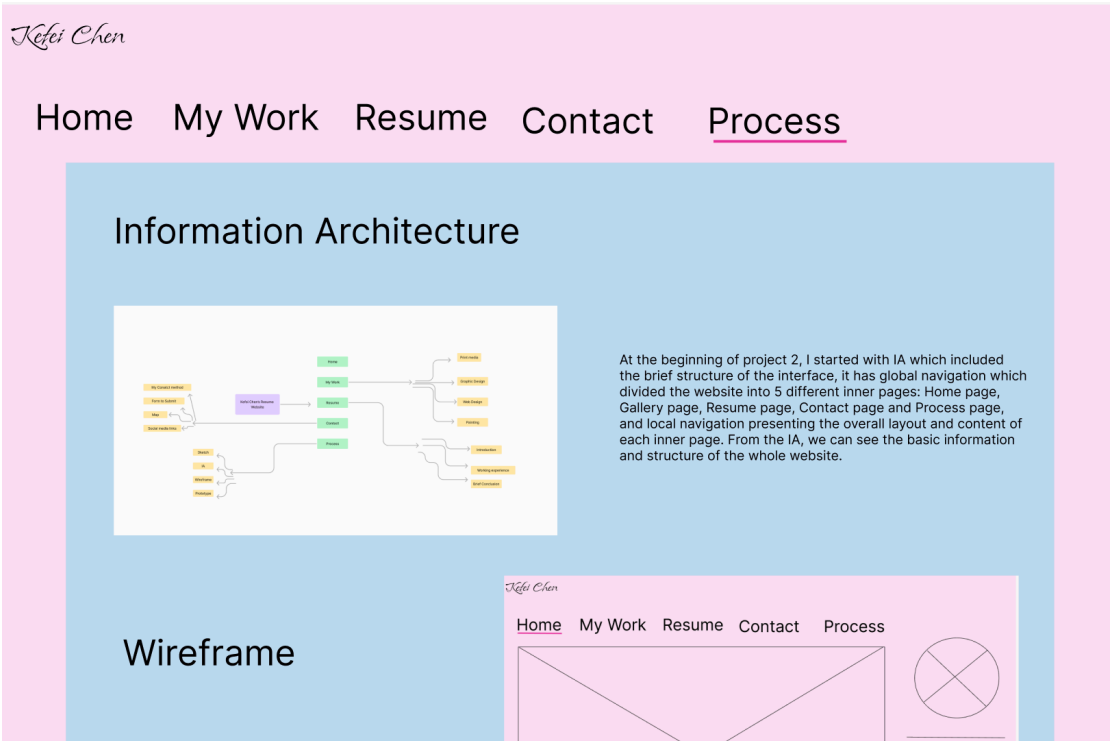

Working Experiences

Job title	Company name	Time
Art Design Intern	Shiguang New Media	5.2023-8.2023
Teaching Assistant	EPIE Summer School	7.2023-8.2023
Summer Intern	Suqian Municipal Government	6.2023-7.2023

Skills

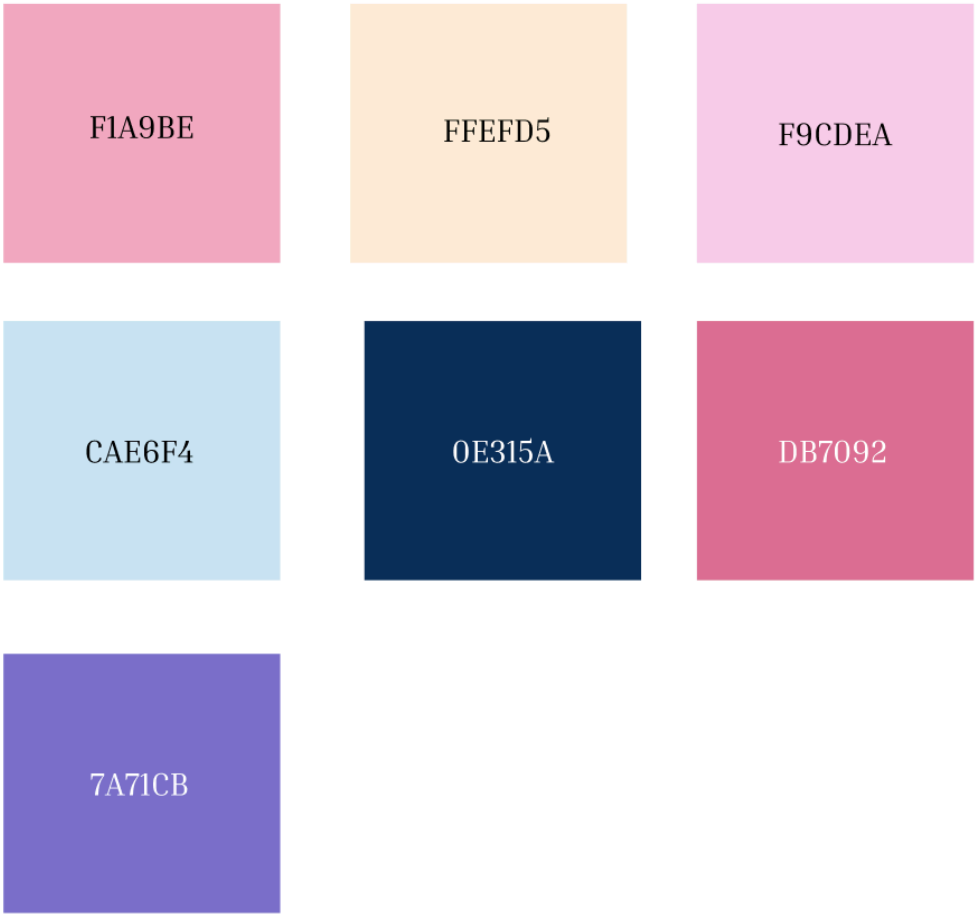

. XD
. PS

To collaborate with rich media and give me a more direct view of the layout, I added the words and images to the prototype and developed the final web design based on it.

My colour palette for the final web design

Final Web design

In the final version of my web design, I utilized coding skills in Dreamweaver to implement adjustments aimed at enhancing the overall user experience. These adjustments involved incorporating additional photos to enrich the media content and modifying layouts to overcome coding limitations or introduce visual effects such as photo galleries. Moreover, I applied the foundational rationale for web design outlined by Dan Brown's 8 principles, while ensuring compliance with WCAG 2.0 accessibility standards.

Drawing inspiration from Brown's principles, I treated the website as a dynamic object, imbuing the Information Architecture (IA) with a clear structure and distinct inner pages to foster a lively and substantial user experience. Each of the five inner pages serves as global navigation, facilitating users' navigation and comprehension of the overall content while offering clear choices. Upon entering the website, users encounter the home page and prominent global navigation bars, serving as direct entry points.

This initial exposure piques users' curiosity, encouraging them to further explore the more detailed information presented on the inner pages. To aid comprehension, I provided concrete examples within each page, elucidating the intended structure and information conveyed. For instance, the Gallery page shows my work, offering tangible examples such as a graphic design magazine demonstrating my skills and suitability for potential job roles. Adhering to the front door principle, I ensured that every page remained interactive and informative, with consistent use of colours from the specified palette, selective font sizing and styles, and clear navigation elements. This approach caters to users and recruiters who may access pages beyond the home page, ensuring a cohesive and engaging experience throughout the website. Furthermore, to accommodate future expansion and additional messaging, I intentionally allocated space within the design for the growth and evolution of the website. This allows for integrating new content while maintaining the overall coherence and functionality of the web presence.

WCAG2.0

To ensure the accessibility and usability of my website, I adhered to the principles outlined in WCAG 2.0. Firstly, in terms of perceivable, I prioritized making all information and components on each page easy to understand. To achieve this, I opted for a generously sized font, ensuring readability for all users. Additionally, I ensured that all videos featured on the website were accompanied by audio, and the layout was minimized while ensuring content stood out against the background with distinctive colour contrasts. Secondly, to maintain operability, I designed every button on the website to be clickable, providing users with enough interactions. Furthermore, I implemented features that afford users enough time to comprehend messages, ensuring no rush or interruptions. The inclusion of navigation bars across the website can also guide users to locate desired content. In terms of understanding, I prioritized clarity and readability in all textual content presented on the website, employing language and formatting techniques that are easy to comprehend for a diverse audience. Consistency in the sequence of navigation bars across all inner pages was also upheld, ensuring logic. Regarding robustness, I utilized HTML files, which enable authors to code and visualize designs effectively. Additionally, I ensured that every element within the website possesses complete start and end tags, thus preventing any errors or inconsistencies when rendering the website across various browsers.
